

SCAN is a Proven Dependable, Location Specific Alarm System Designed for the Safety and Security of Your Employees

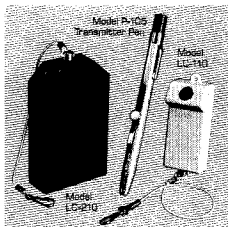

No matter what the source of emergency, whether it be the result of hazardous work conditions, violence, a security breach, or medical alert, your personal SCAN transmitter will not only summon the help you need, but it will also pinpoint your exact location.

Because SCAN utilizes proven ultrasonic technology, the system is ideally suited for use in RF exclusion areas, often found in power generating facilities. Automatic "man down" reporting is a key SCAN feature, essential for overall employee/employer safety, protection, and "peace of mind."

PRODUCTS, INC.

Easy to install and operate, SCAN performs in virtually any environment

Choice of Transmitters

In the event of emergency, the ease of equipment operation and dependable performance must be primary considerations. After years of use in rough, hazardous conditions, SCAN has performed with proven dependability. SCAN transmitters are extremely easy to operate. Depending upon style, simply push a button or pull a pin.

Model LC-210, our rugged, belt mounted transmitter features automatic "man down" reporting and twin transducers for continuous multi-directional signaling. Our lightweight LC-110 weighs less than 1.5 oz. and has been designed especially for use by medical, clean room, and laboratory personnel.

Both units provide a "low voltage" indicator to guard against unexpected battery failure. When worn properly, they will alarm upon forced removal.

Our "pen" transmitter contains no electronics and no batteries. Because of its design, the pen is often preferred for use by administrative personnel.

A Variety of Receivers and Control Panels with Simple ON/OFF Switching and Features for Expanded Capability

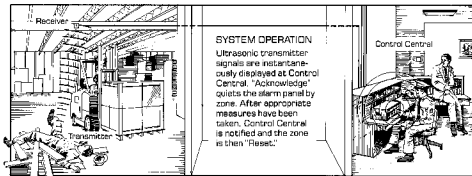

SCAN is a three phase system: transmitter to receiver to control center. A single control center can monitor, by zone, selected areas or an entire facility.

SCAN control panels indicate alarms by pinpointing source location with both visual and audible annunciation. Due to simple one- or two-button operation, employee training is minimal. "Acknowledge" and "Reset" are the only commands required. A small lamp on each receiver provides a comforting confirmation to the sender that his call for help has been registered at Control Central.

Add-on features include audio monitor-

ing, which enables Control Central to "listen in" by zone; ATD, audio threshold detection, which signals Control Central, by zone, when the audio level has surpassed a preset threshold; and graphic display interface.

There is virtually no limit to the number of locations or zones that can be monitored. SCAN receivers are unobtrusive and are ideally suited for retrofit applications as well as new construction. Where more suitable, our dual technology or our environmentally sensitive receiver units may be used. All SCAN components are compatible, thus providing an expandable, cost-effective system for your safety and security needs.
